

Prompt for creating a new tool for wordineer

I'm building a new tool page for Wordineer — a static site hosted on Cloudflare. The site uses a Python template system. Here's how it works:

SYSTEM OVERVIEW

- template-deploy/build.py reads tools.json + tools-src/*.html → outputs finished HTML to output/
- Shared parts (nav, footer, tool grids) are in template-deploy/template/ and auto-generated from tools.json
- Tool-specific content lives in a single file: template-deploy/tools-src/your-tool-name.html
- The live JS engine is at wordineer-deploy/scripts/tool-engine.js (WORDINEER global)
- Fonts are self-hosted in wordineer-deploy/fonts/ (DM Sans + DM Serif Display)
- Global CSS is at wordineer-deploy/styles/global.css

THE NEW TOOL I WANT

I'm building a new tool page for Wordineer — a static site hosted on Cloudflare. The site uses a Python template system. Here's how it works:

SYSTEM OVERVIEW

- template-deploy/build.py reads tools.json + tools-src/*.html → outputs finished HTML to output/
- Shared parts (nav, footer, tool grids) are in template-deploy/template/ and autogenerated from tools.json
- Tool-specific content lives in a single file: template-deploy/tools-src/your-toolname.html
- The live JS engine is at wordineer-deploy/scripts/tool-engine.js (WORDINEER global)
- Fonts are self-hosted in wordineer-deploy/fonts/ (DM Sans + DM Serif Display)
- Global CSS is at wordineer-deploy/styles/global.css

THE NEW TOOL

A random sentence generator at URL **/random-sentence-generator/**.

The user controls:

- **Count** — 1–10 sentences (number input)
- **Category** — All / Nature / Adventure / Humor / Motivational / Everyday Life / Friendship / Mystery / Abstract / Food & Cooking / Travel / Work & Career / Science & Technology
- **Tone** — All / Neutral / Dramatic / Humorous / Poetic / Inspirational /

Suspenseful / Melancholic

- **Sentence type** — All / Simple / Compound / Complex / Compound-Complex
- **Length** — Any / Short (5–8 words) / Medium (9–14 words) / Long (15+ words)

Display toggles (below filters, styled like the "show definitions" toggle in the word generator):

- **Show word count** — default ON — appends "(11 words)" to each sentence
- **Show sentence type label** — default OFF — shows badge e.g. "Compound" on each card
- **Show category tag** — default OFF — shows category badge on each card

Each sentence card has:

- The sentence text
- A **copy button** (copies that sentence to clipboard, shows checkmark tick feedback)
- A **heart/save button** (saves to the saved strip below, same behavior as word generator)

Saved strip below the tool and copy-saved button must match **random-word-generator.html** exactly — same classes, same UX pattern, same saved-tags layout.

The spacebar triggers regenerate (same as word generator). The tool layout mirrors **random-word-generator.html** exactly: left control panel + right results panel, same **tool-split / tool-card / ctrl / words-panel** structure.

SENTENCE DATA

Create a new file: wordineer-deploy/data/sentences.json

Format — compact array-of-arrays, one sentence per entry:

[sentence, category, tone, type, length_band]

Example:

json

["The old lighthouse stood at the edge of the cliff, its beam sweeping endlessly across the dark water.", "nature", "dramatic", "complex", "long"]

Field values:

- category: nature adventure humor motivational everyday friendship mystery abstract food travel work science
- tone: neutral dramatic humorous poetic inspirational suspenseful

melancholic

- type: simple compound complex compound-complex
- length_band: short medium long

Generate exactly 1,200 sentences distributed as follows:

Category	Count
Everyday Life	150
Nature	130
Motivational	120
Adventure	110
Friendship	100
Humor	100
Abstract	90
Science & Technology	90
Mystery	80
Travel	80
Work & Career	80
Food & Cooking	70

Weight common filter combos heavily (neutral + medium + simple, neutral + medium + compound) and include at least 5–10 entries for every rare combo. Every sentence must be original, natural-sounding English. No sentence should start with "I". No two sentences should be identical.

The JS in the tool reads this file via `fetch('/data/sentences.json')` on page load, caches it in `sessionStorage` under key `wnr_sentences_v1`, and falls back to a 20-sentence inline seed array (hardcoded in the tool's `<!-- SLOT:init -->`) while the fetch completes.

WHAT TO BUILD

1. `template-deploy/tools-src/random-sentence-generator.html`

Use these exact slots:

```
<!-- CONFIG { "url": "/random-sentence-generator/", "output": "random-  
sentence-generator/index.html" } -->  
<!-- SLOT:meta -->  
<!-- SLOT:style -->  
<!-- SLOT:hero -->  
<!-- SLOT:tool -->  
<!-- SLOT:ad_b -->  
<!-- SLOT:explainer -->  
<!-- SLOT:faq -->  
<!-- SLOT:who -->
```

<!-- SLOT:init -->

SLOT:meta — include:

- <title>Random Sentence Generator — Free, Instant, No Sign-up | Wordineer</title>
- Meta description targeting: "random sentence generator", "random sentence generator for writers", "random English sentence", "sentence generator by category"
- Canonical: <https://wordineer.com/random-sentence-generator/>
- Full OG tags matching the word generator pattern
- JSON-LD FAQPage schema (reuse the FAQ questions from SLOT:faq)

SLOT:style — tool widget CSS only, no global styles. Use CSS variables: --brand, --brand-dark, --brand-light, --text, --text-2, --text-3, --bg, --bg-2, --bg-3, --border, --border-2, --radius-lg, --shadow. Mirror the word generator's control panel and results panel styles. Add styles for: sentence cards (larger text block vs. single word), badge chips for type/category tags, word-count annotation.

SLOT:hero — badge "Free · No sign-up · Instant", <h1>Random sentence generator</h1>, subtitle: "Generate random English sentences instantly — filter by category, tone, type, and length. One click, no sign-up."

SLOT:tool — the full interactive widget HTML. Left panel: all 5 filters + 3 display toggles + Generate button + Reset link. Right panel: sentence count display, Copy all + Regenerate buttons, sentence list. Below tool: saved strip (heart-saved sentences). Wire all control IDs to match what SLOT:init passes to WORDINEER_SENTENCES.init({}).

SLOT:ad_b — reuse the Grammarly 728×90 leaderboard placeholder from random-word-generator.html verbatim.

SLOT:explainer — minimum 400 words of unique SEO copy. Cover these angles:

- What a random sentence generator is and who needs it
- Writers using it to break writer's block and warm up
- Students using the sentence type filter to study grammar (simple vs compound vs complex — explain the difference briefly, this is a unique angle no competitor covers)
- ESL/EFL learners building natural English intuition
- Teachers using it to create grammar exercises
- The category and tone filters and why they matter for creative writing
- Internal link to /random-word-generator/ (anchor text: "random word generator") and mention the pairing
- Do not mention any competitor sites by name

SLOT:faq — 5 accordion items, unique to this tool:

1. What is a random sentence generator?
2. What is the difference between a simple, compound, and complex sentence?
3. Can I use these sentences in my writing or school work?
4. How do the category and tone filters work?

5. Why does the generator sometimes show fewer sentences than I requested?

SLOT:who — 4 "Who uses this" cards: Writers, Students & Teachers, ESL Learners, Game Masters & Creatives

SLOT:init — implement a self-contained WORDINEER_SENTENCES module (do NOT modify tool-engine.js). The module must:

- Have an inline seed array of 20 sentences (5 per length band, varied categories) to render instantly on load
- fetch('/data/sentences.json') and cache in sessionStorage under wnr_sentences_v1
- Filter the pool by all 5 active filter values on every generate call
- Respect the 3 display toggles reactively (re-render on toggle change without regenerating)
- copyAll(), copySaved(), copyItem(sentence, btn) — clipboard + checkmark tick feedback matching word generator
- toggleSave(sentence) — heart save/unsave, updates saved strip below tool
- removeSaved(sentence) — remove from saved strip
- showToast(msg) — reuse #toast element from global layout
- Spacebar → generate (guard against firing in input/select/textarea)
- init(cfg) accepting IDs for all controls

2. wordineer-deploy/data/sentences.json

The full 1,200-sentence dataset as described above. Output as a single minified JSON line (array of arrays, no pretty-printing).

3. tools.json entries (list separately, copy-paste ready)

- Entry for mega nav menu — category: "Generators", href: /random-sentence-generator/, text: "Random Sentence Generator"
- Entry for more_word_tools card grid — href, name: "Random Sentence Generator", desc: "Generate sentences by category, tone, and type.", icon_bg: #E8F4FD, icon_path: (use a simple SVG lines/text icon)
- Entry for footer_cols — column: "Generators", href: /random-sentence-generator/, text: "Random Sentence Generator"

WHAT I NEED YOU TO BUILD

1. tools-src/random-sentence-generator.html — the tool source file with these exact slots:

```
<!-- CONFIG { "url": "/random-sentence-generator.html", "output": "random-
```

sentence-generator.html" } -->

<!-- SLOT:meta --> title, description, canonical, OG tags, JSON-LD FAQPage schema

<!-- SLOT:style --> CSS for this tool's widget only (no global styles)

<!-- SLOT:hero --> hero badge, h1, subtitle paragraph

<!-- SLOT:tool --> the interactive widget HTML

<!-- SLOT:ad_b --> 728x90 leaderboard ad zone (reuse the Grammarly placeholder)

<!-- SLOT:explainer --> 300+ words of unique SEO copy about the tool

<!-- SLOT:faq --> 3–5 FAQ accordion items (unique questions for this tool)

<!-- SLOT:who --> "Who uses Wordineer" cards relevant to this tool

<!-- SLOT:init --> WORDINEER.init({...}) + any page-specific JS

2. The tools.json entries I need to add manually:

- Entry for "mega" (nav menu) — category + href + text

- Entry for "more_word_tools" (card grid) — href, name, desc, icon_bg, icon_path SVG

- Entry for "footer_cols" — which column + href + text

CONSTRAINTS

- No external CSS frameworks or JS libraries — vanilla only
- No Google Fonts calls — fonts are self-hosted
- All CSS inside <!-- SLOT:style --> only
- Use CSS variables for all colors — no hardcoded hex except in ad placeholders
- Tool must render instantly on load from the inline seed (no visible blank state)
- WORDINEER_SENTENCES must be fully self-contained in <!-- SLOT:init --> — do not touch tool-engine.js
- All widget element IDs must be prefixed sg- to avoid collision with the word generator (e.g. sg-list, sg-count, sg-ctrl-category)
- Ad placeholders use classes ad-sidebar, ad-leaderboard, ad-rect — keep as-is
- Output format: complete tools-src file ready to save, then tools.json snippets separately

OUTPUT FORMAT

Give me the complete tools-src file ready to save, then separately list the tools.json snippets I need to add (copy-paste ready, with the correct JSON format).
