

The cd line takes you to the right folder, then the second line runs the script. You can open Terminal from Spotlight (Cmd+Space → type "Terminal").

When you run:

```
python3 build.py
```

It does the following:

- Reads tools.json (navigation, footer, tool grid)
- Reads template/head.html
- Reads template/nav.html
- Reads template/more-tools.html
- Reads template/footer.html

Then for every HTML file in tools-src/:

- Reads the source file (e.g., random-word-generator.html)
- Extracts each SLOT (meta, style, hero, tool, etc.)
- Combines everything into output/index.html

If you had 5 files in tools-src/, it builds 5 pages in one command.

Steps to add a new tool:

Step 1 — Duplicate the source file

tools-src/random-word-generator.html → copy it

tools-src/random-sentence-generator.html → rename the copy

Step 2 — Update the CONFIG at the top of the new file

```
{  
  "url": "/random-sentence-generator.html",  
  "output": "random-sentence-generator.html"  
}
```

Step 3 — Replace the slots with your new tool's content

- meta → title, description, canonical URL, OG tags
- style → CSS
- hero → page heading/subtitle
- tool → HTML widget
- ads → leave as is
- explainer → 300+ words
- faq → questions
- who → target users
- init → JS initialization

Step 4 — Add the tool to tools.json in 3 places

- mega → navigation menu
- more_word_tools → tool grid
- footer_cols → footer links

Step 5 — Run the build

```
cd "/Users/garrickdeetan/Documents/Random Word Generator Tool Site/template-deploy"
```

```
python3 build.py
```

This builds:

- output/index.html
- output/random-sentence-generator.html

Step 6 — Deploy

Copy files from output/ to your deploy folder, then push to Cloudflare Pages.
