

Wordineer - New Tool Deployment Guide

Overview

The template system lets you create new Wordineer tool pages without ever manually copying the nav, footer, or tool grids. You write tool-specific content in one source file, update tools.json with the new links, run one Python command, and get a finished HTML page ready to deploy to Netlify.

Folder Structure

```
template-deploy/
  tools.json          <- edit nav / footer / grid links here
  build.py            <- run this to build all pages
  template/
    head.html         <- shared <head> boilerplate
    nav.html          <- shared nav + mega menu
    more-tools.html    <- shared tool grids + content wrapper
    footer.html        <- shared footer + script tags
  tools-src/
    random-word-generator.html <- tool-specific content (one file per tool)
    your-new-tool.html      <- add new tools here
  output/
    index.html          <- finished pages land here
```

How to Add a New Tool (Step by Step)

1. Duplicate a tool source file

Copy tools-src/random-word-generator.html and rename it for your new tool.

Example: tools-src/random-sentence-generator.html

2. Update the CONFIG block at the top of the file

Change "url" and "output" to match the new page:

"url": "/random-sentence-generator.html"

"output": "random-sentence-generator.html"

3. Replace the tool-specific slots with your content

Each <!-- SLOT:name --> section holds a different piece of the page:

meta -> title, description, canonical URL, OG tags, JSON-LD schema

style -> CSS unique to this tool's widget

hero -> the h1 headline and subtitle

tool -> the interactive widget HTML

ad_b -> the 728x90 leaderboard ad zone (can reuse as-is)

Wordineer - New Tool Deployment Guide

explainer -> 300+ words of unique copy about the tool (important for SEO)

faq -> FAQ accordion items unique to this tool

who -> the "Who uses Wordineer" cards

init -> the WORDINEER.init() call + any page-specific JS

4. Add the tool to tools.json

Open tools.json and add the new tool to every section where it should appear:

"mega" -> shows in the hamburger nav menu

"more_word_tools" -> shows in the card grid below each tool

"footer_cols" -> shows in the footer link columns

"other_tools" -> use if it belongs in the Other Tools list

5. Run the build script

Open Terminal and run:

```
cd "/Users/garrickdeetan/Documents/Random Word Generator Tool Site/template-deploy"
python3 build.py
```

Finished HTML files appear in the output/ folder.

6. Deploy

Copy the file(s) from output/ into wordineer-deploy/.

wordineer-deploy/ is the folder Netlify publishes. Never edit it by hand.

Slot Reference

Every tools-src file is divided into named slots. The build script reads each slot and places it in the correct position in the final HTML. You only ever edit the slots inside your tool source file, never the shared template files.

Slot name	What goes here
meta	title, meta description, canonical URL, Open Graph tags, JSON-LD schema
style	CSS specific to this tool's widget (goes inside <style> in <head>)
hero	The badge, h1 headline, and subtitle paragraph at the top
tool	The full interactive widget HTML (filters, word list, saved section)
ad_b	The 728x90 leaderboard ad zone that appears below the widget
explainer	Long-form copy explaining the tool (300+ unique words for SEO)
faq	FAQ accordion items - use unique questions per tool page
who	The "Who uses Wordineer" use-case cards at the bottom

Wordineer - New Tool Deployment Guide

WORDINEER.init() call with element IDs + any page-specific JS

Wordineer - New Tool Deployment Guide

To update the nav, footer, or tool grids across every page at once, edit tools.json then re-run build.py. You never need to touch the individual tool source files for this.

- Add or rename a tool in the nav menu -> edit the "mega" array in tools.json
- Add a tool to the card grid -> edit "more_word_tools" in tools.json
- Add a tool to the footer columns -> edit "footer_cols" in tools.json
- Add a category to Other Tools -> edit "other_tools" in tools.json

Run Command (Quick Reference)

```
cd "/Users/garrickdeetan/Documents/Random Word Generator Tool Site/template-deploy"  
python3 build.py
```

The output/ folder is safe to delete and rebuild at any time. It is always regenerated fresh when you run build.py.
