

when i run time command `cd "/Users/garrickdeetan/Documents/Random Word Generator Tool Site/template-deploy"`
`python3 [build.py](http://build.py)` does it pull contents from random-word-generator.html? what if i create a new tool, what are the steps?

Yes, exactly. Here's what happens when you run it:

```
python3 build.py
├── reads tools.json           (nav links, footer links, tool grids)
├── reads template/head.html
├── reads template/nav.html
├── reads template/more-tools.html
├── reads template/footer.html
└── for every .html file in tools-src/:
    ├── reads tools-src/random-word-generator.html ← YES, pulls from here
    ├── extracts each SLOT (meta, style, hero, tool, etc.)
    └── stitches everything together → output/index.html
```

If you had 5 files in `tools-src/`, it would build 5 pages in one command.

Steps to add a new tool:

Step 1 — Duplicate the source file

```
tools-src/random-word-generator.html → copy it
tools-src/random-sentence-generator.html ← rename the copy
```

Step 2 — Update the CONFIG at the top of the new file

```
<!-- CONFIG
{
  "url": "/random-sentence-generator.html",
  "output": "random-sentence-generator.html"
}
-->
```

Step 3 — Replace the 9 slots with your new tool's content

SLOT:meta	→ new title, description, canonical URL, OG tags
SLOT:style	→ CSS for the new widget
SLOT:hero	→ new h1 + subtitle
SLOT:tool	→ the new tool's HTML widget
SLOT:ad_b	→ leave as-is (reuse Grammarly placeholder)
SLOT:explainer	→ 300+ words unique to this tool
SLOT:faq	→ new FAQ questions
SLOT:who	→ who uses this tool
SLOT:init	→ <code>WORDINEER.init()</code> with the new widget's element IDs

Step 4 — Add the tool to `tools.json` in 3 places

```
"mega"      → so it appears in the nav hamburger menu
"more_word_tools" → so it appears in the tool card grid
"footer_cols" → so it appears in the footer links
```

Step 5 — Run the build

```
cd "/Users/garrickdeetan/Documents/Random Word Generator Tool Site/template-deploy"
python3 build.py
```

Both pages build at once — [output/index.html](#) and [output/random-sentence-generator.html](#).

Step 6 — Deploy

Copy both files from `output/` into `wordineer-deploy/`, then push to Cloudflare Pages.
